

# Heading home in 0-30...

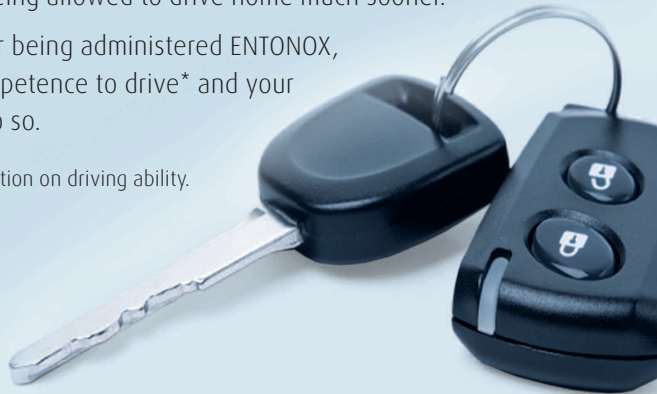

## ...after ENTONOX<sup>®</sup> analgesia

Now your patients can benefit from being allowed to drive home much sooner.

They may drive home 30 minutes after being administered ENTONOX, provided you have assessed their competence to drive\* and your patient feels fit and well enough to do so.

\*You should consider the effect of other medication on driving ability.

BOC: Living healthcare

A Member of The Linde Group

BOC Healthcare has undertaken a clinical trial to secure a significant change to patient drive time for its ENTONOX<sup>®</sup> licence.

This change means your patient can drive home just **30 minutes after ENTONOX administration**, provided you have judged them competent and they agree that they feel able to drive.

This marks a significant advance in patient care and management for short-term painful procedures using ENTONOX analgesia, and means:

- Less disruption for your patients, as they won't always need to make complex travel arrangements.
- An improved patient experience, as they can choose ENTONOX analgesia, when it is important to them to return home or get back to work as soon as possible after the procedure is over.

- Faster patient turnaround, particularly advantageous in outpatient clinics/ colonoscopy units.
- Less time spent monitoring patients, giving you more flexibility in your busy work schedule.
